

Sync Configuration

Manage sync settings of individual vessels or vessel types

Synchronizing data can be so easy! MESPAS monitors the entire sync process and ensures the secure data transfer between office and vessel.

Now you can customize the process according to your individual preferences. In doing so, you are free to adjust sync settings for individual vessels, vessel groups (e.g. bulkers) or the entire fleet, and to automate the process. As in the past, we continue to synchronize only data that has changed.

mespas Sync Configurator can

Set maximum amount of transferred data

- Set maximum amount of data your vessel can receive from server when synchronizing per e-Mail
- Set maximum amount of data your vessel can receive from server when synchronizing online
- Set maximum amount of data your vessel can send to server when synchronizing online

Enable file split function

- You can split sync files into parts (e.g. if you have data limitations to your e-Mail communication) and send multiple e-Mails
- You may define maximum size of split files

Enable or disable sync of software updates

- Control when to push new software version updates to the vessels
- Control whether or not vessels may only send sync files but not automatically receive data from server

Data is ready for reporting

As soon as the data is synchronized, the data is ready (no human intervention needed) for reporting or any other form of data processing. This is part of our unique cloud based approach of doing business.
